                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalis dipeptidyleptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a bubstituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protein and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g., gingivitis or periodontitis). The present DNA sequence encodes the Porphyromonas gingivalis dipeptidase-7 (DPP-7) enzyme of the invention.

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus progenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a bilogical sample. (I) is used to detect Streptococcus in a bilogical sample. (I) is used to detect Streptococcus in a become or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity contractography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1978 GGACGTTTGTCTCGAAAATTGATTAATGGTATTAGGGGATAAGCAATCTGGCAAAACAATA 2037

AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ArgHisThrGlyAspPheSerValPheArgValTyrAlaGlyAlaAspAsnArg-ProAl 240

Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY343812. AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivalis is involved in periodontal disease

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antiblotics, the essential cannot be accepted by the discovery of novel antiblotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella proteminae, Pseudomonas aeruginosa and Enterococcus facells. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WipO at the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        203
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 283 SerTrpGlyValGluAspArgIleGluAsnGluAsnAsnProArgIleGluValArgGly 302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CAGGCTAAGGTTGAGGAGCGCTTGCGTGAGGGCATTTCCCGCTATGACCTTGGTCGT 330

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     is invention describes the isolation of a novel Streptococcus neumoniae valS protein. The new polypeptide and antagonist are seful for the treatment of an individual with abnormal valS cotein levels, by administering valS to individuals requiring als polypeptide, and administering the antagonist to individuals equiring inhibition of valS polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               w vals polypeptide and polynucleotide - useful for treatment of inditions associated with abnormal vals protein levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -----CACGCT

This DNA encodes a S. pneumoniae vals polypeptide (EC 6.1.1.9), a member of the valyl tRNA synthetase family. The polypeptide can be expressed recombinantly by transforming host cells with vectors comprsing the vals gene. Vals polypeptides and polynuclectides are useful for diagnosing diseases due to an infection of an organism and also the stage and type of the infection. The polypeptides are also used for screening for their modulators which can be used in the treatment of diseases. Diseases diagnosed, prevented or treated include otitis media, conjunctivitis, pneumonia, bacteremia, sinusitis, pleural empyema, endocarditis and especially menimptis. Vals polypeptides, polynucleotides and their (ant)agonists can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -----LysAspValArgMetValPheAlaPro 203

XX

This sequence represents DNA encoding Streptococcus pneumoniae valy1 tRNA synthetase (vals, NCIMB Deposit No. 40794). Streptococci are the cause of several types of human diseases, including othism encoded, conjunctivitis, pneumonia, bacteraemia, sinusitis, pleural empyema, endocarditis and sepecially meningitis. The frequency of S. pneumoniae infections has risen dramatically over the past 20 years, probably due to the emergence of multiply antiblotic resistant strains and an increasing population of immunocompromised people. Vals represents a target for new antibacterial companies. Inhibition of tRNA synthetases such as vals leads to a reduction in the levels of charged tRNA, which triggers a cacade of responses (known as the stringent response) resulting in a state or dormancy in the bacterium. Vals, its variants and fragments, anti-vals antibodies, vals inhibitors and nucleotides encoding vals may be used in the diagnosis, prevention and treatment of bacterial infections such as meningitis. Wals can be used to screen compounds for inhibitory activity. Vals can be used to screen compounds for inhibitory activity. Vals can be used to screen compounds for inhibitory activity. Vals can be used to screen compounds for inhibitory activity. Vals can be used to screen compounds for inhibitory activity. Vals can actibodies which protect against bacterial invasion into damaged tissues. Such antibodies could, for example, prevent the adherence of bacteria to wounds. Nucleotides encoding vals may be used as diagnostic reagents and therapeutic or prophylactic agents, particularly axis sequence 2652 BP, 733 A, 612 C, 621 G, 686 T, 0 other;

                                                                                                                                                                                                                                                                                                                     The invention describes an isolated vals polynucleotide encoding a mature polypeptide the same as that expressed by a vals gene contained in a deposited strain of Streptococcus pneumoniae, a complementary sequence or a polynucleotide containing at least 15 continuous bases of the polynucleotide. The antibody to the encoded protein is used for the treatment of microbial infection. This sequence encodes Vals derived from

Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybriddise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating molecules whose nucleotide sequence is homologous to amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fragments of the S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEO ID NO:1 to 391 (AAV52134 to AAV52524) are genomic fragments from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying

The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          282

e invention relates to a protein (ABP25413-ABP30895) from group B reptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS treptococcus progenes). Comprising one of 5481 sequences (S1), given in e specification. The proteins have antibacterial and antiinflammatory tivity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and tibodies that bind (I) are used in the manufacture of medicaments for threatment or prevention of infection or disease caused by cleic acids encoding (I) are used to detect Streptococcus in a closical sample. (I) is used to detect Streptococcus in a closical sample. (I) is used to determine whether a compound binds to i. A composition comprising (I) or a nucleic acid encoding (I), may be as a vaccine or diagnostic composition. The disease caused by reptococcus that is prevented or treated may be meningitis. Nucleic definite mencading (I) may be used to recombinantly produce (I) and may be romatography, immunoassays, and distinguishing/identifying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; A streptococcus; Streptococcus pyogenes; antibacterial; gene; flammatory; infection; vaccine; meningitis; gene therapy; ds.

WO9952947-A2.	21-OCT-1999.	12-APR-1999; 99WO-CA00307.	14-APR-1998; 98US-0059584.	(CONN-) CONNAUGHT LAB LTD.	Schryvers AB, Harkness RE, Loosmore SM, Du	WPI; 1999-620376/53. P-PSDB; AAY43380.			his sequence encodes the Moraxella catarrhalis strain LES1 tran	binding protein (Tbp2) of the invention. This sequence is also referred to as the TbbB gene. The TbbB gene is used to produce recombinant Tbp2:

```
Moraxella infections, e.g. otitis media. The Tbp2 proteins are useful as antigens, either in vaccines (including components of conjugate vaccines that contain antigens from other bacteria or from tumours, in which case they elicit production of antitumour antibodies that may be coupled to chemotherapeutic agents or biologically active agents) or to raise antibodies (for use as diagnostic reagents and for treating Moraxella infections), also for detecting Moraxella antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      985 ACAGACAAAAATAACAAGCCCAGTGATTACAATGGTGCATATGGTCATAGCAGTGAATTT 1044

```
The present invention relates to nucleic acid sequences (ABQ67188-ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       also for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1735 ACTGCAGGACTCAAAGGCATGGGTAAATTCGGTAAGTTG------GCTAGCGGT 1782

                                                                                                                                                                                                                                                                                                                                               (ABO67188-ABO71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in
